

How to setup a license for Keil μ Vision

A trivial guide for setting up license Keil μ Vision for compiling code bigger than 32Kbyte.

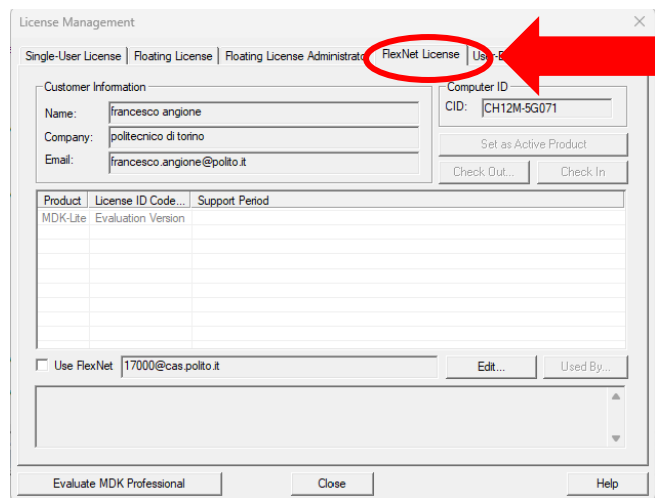

1. Open the license management tool.

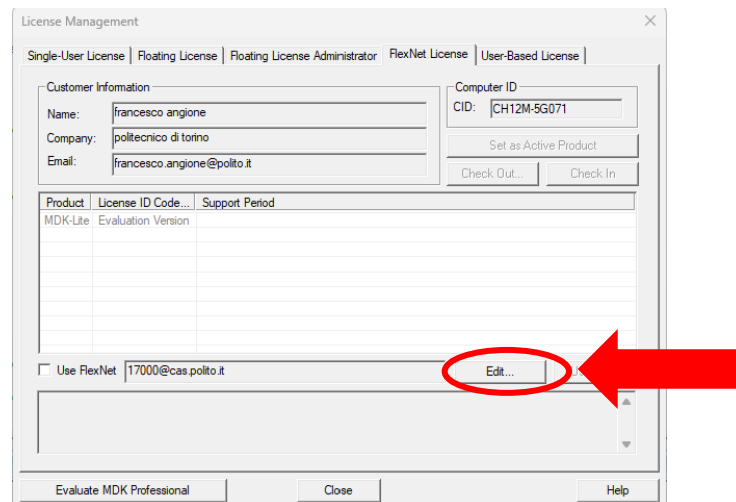

2. A new window will open. Where only the evaluation license is present.

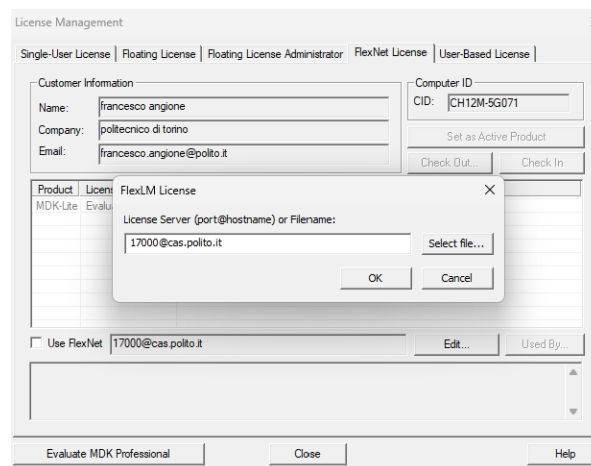

3. Select the FlexNet License tab.

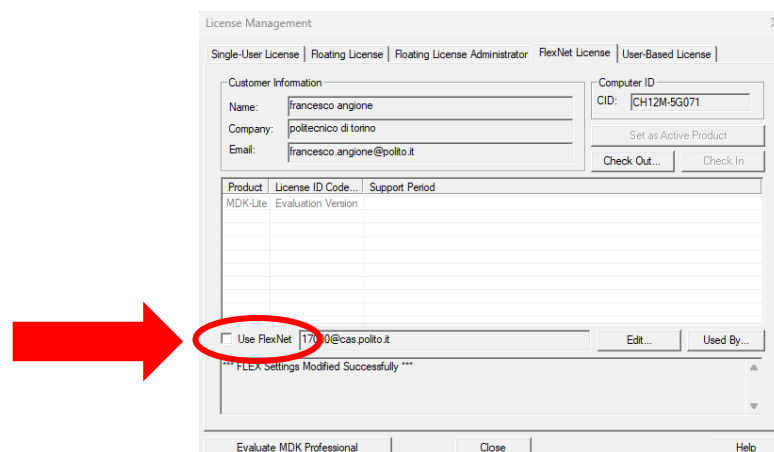

4. You have to click on edit FlexNet License.

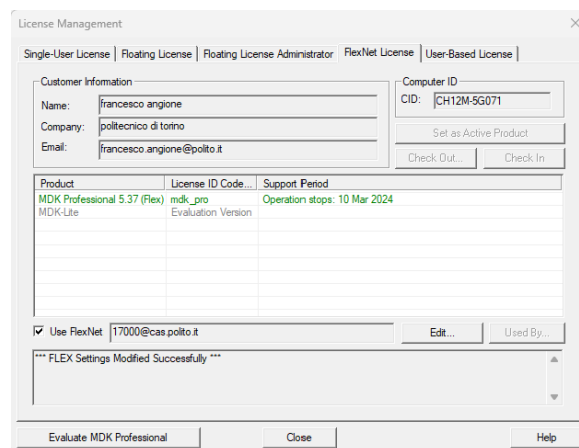

5. A new window appears. You must insert the string
“17000@cas.polito.it”

6. Press Ok and then activate the license.

7. Afterward the activation, you should have this list of licenses.

Notes:

- You may act on the Optimization levels in order to reduce the Code size (it increases the complexity during debugging section since it may change the underlying assembly).
- Remember that Wi-Fi could block communication to unknown servers (for example, “Eduroam”).
- Remember that networks are based on “best-effort” delivery. Therefore, the server used for license distribution may not be reactive as you think. It has not been designed for handling 500 license requests!
- Do not try re-distribution or re-routing to/from the license servers and any DDoS attacks.
